

PCT/EP03/08796

Claims

1. A method for detecting disseminated tumor cells
5 from a body fluid, in which non-tumor cells which
express at least one of cytokeratins 1-20 are separated
from tumor cells which express at least one of
cytokeratin 1-20, in which
- 10 (a) tumor cells are enriched by a cell separation
medium which has a density in the range from 1.055 to
1.065 g/ml being overlaid with the body fluid and being
centrifuged, thus separating cytokeratin-positive and
cytokeratin-negative blood cells from one another, with
15 the enriched tumor cells being present in the same
fraction as the cytokeratin-negative blood cells; and
(b) it is determined whether the enriched cells
express an epithelial marker, which is cytokeratin,
characterized in that there is reverse transcription of
20 mRNA from the enriched cells, and a PCR is carried out
with at least one cytokeratin-specific primer, where
the cytokeratin is selected from the group consisting
of cytokeratin 1 to 20.
- 25 2. The method as claimed in claim 1, characterized in
that the centrifugation is carried out in a vessel
which is divided by a porous barrier, a filter, a sieve
or a flap into an upper and a lower compartment, the
cell separation medium being introduced into the lower
30 compartment, and the body fluid being put in the upper
compartment.
3. The method as claimed in claim 2, characterized in
that the porous barrier, the filter, the sieve or the
35 flap have a thickness of 0.5-10 mm, preferably of
1-5 mm.
4. The method as claimed in claim 2 or 3,

AMENDED SHEET

characterized in that the porous barrier, the filter, the sieve or the flap have a porous size of 20-100 μm , preferably 20-30 μm .

- 5 5. The method as claimed in either of claims 3 or 4, characterized in that characterized in that the porous barrier, the filter, the sieve or the flap consist of a hydrophobic material or are coated with a hydrophobic material.
- 10
6. The method as claimed in any of the preceding claims, characterized in that the cell separation medium comprises a dye which makes the cell separation medium distinguishable in color from the overlying body
- 15 fluid, and thus simplifies location of the interphase.
7. The method as claimed in any of the preceding claims, characterized in that in step b) there is determination in single or combination analysis of
- 20 whether the enriched cells express at least one epithelial marker, namely one of cytokeratins 1-20.
8. A kit comprising a cell separation medium which has a density in the range 1.055-1.065 g/ml, and means
- 25 for detecting the expression of the epithelial marker cytokeratin, characterized in that the means for detecting the expression of at least one of cytokeratins 1-20 is selected from cytokeratin-specific primers.
- 30
9. The kit as claimed in claim 8, characterized in that a washing buffer, optionally in concentrated form, is additionally present for washing the enriched cells.
- 35 10. The kit as claimed in either of claims 8 or 9, characterized in that at least one centrifugation vessel is additionally present.
